

CLAIMS

1. A device for hair (12) highlighting treatment (10), characterized in that it comprises a small board (14) and a strip (16) with a form memory which, when resting,
5 keeps it in a spirally wound position; at one end of said strip (16) there being a hook (18) which is movably fixed to an end of the board (14), said board (14) having blocking devices (22) suitable for fixing said strip (14) in an at least partially extended position.
- 10 2. The treatment device (10) according to claim 1, characterized in that said blocking devices (22) comprise a lever (24) with a fulcrum (in 26), oscillating according to a main axis of said board (14), an end of said lever (24) being hook-shaped (28), there also being an
15 elastic element (30) which, when resting, pushes the hook (28) against a surface of the board (14).
3. The treatment device (10) according to claim 2, characterized in that, on one side of the board (14) where said strip (16) is extended, there is an extension
20 (32), substantially orthogonal to the board (14) itself, which is positioned below said hook (28), between said hook (28) and said extension (32) there being a space for housing a part of the spirally wound strip (16).
4. The treatment device (10) according to claim 1,
25 characterized in that said strip (16) is made of a trans-

parent material.

5. The treatment device (10) according to claim 1, characterized in that at one end of said strip (16) there is a lath (20), said hook (18), which is "C"-shaped, being joined to said lath (20), and coupled with an edge (21) of said board (14).

6. The treatment device (10) according to claim 1, characterized in that inside the spirally wound strip (16), there is a rod (34), equipped at one end with terminal elements (36), suitable for preventing said rod (34) from sliding out of the spirally wound strip (16).
